

# PREGNANCY, HEART DISEASE & STROKE IN WOMEN

Gina P Lundberg MD FACC

Clinical Director, Emory Women's Heart Center

Associate Professor of Medicine

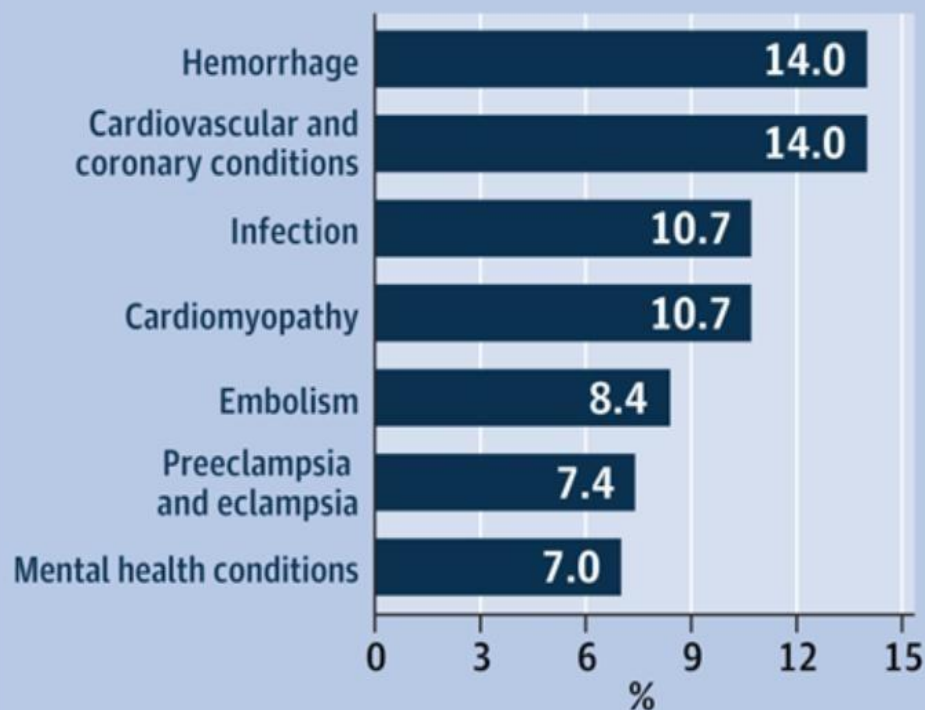

Emory University School of Medicine

@Gina\_Lundberg

# Pregnancy-Related Deaths in the US

## Leading underlying causes of pregnancy-related deaths

## Preventability among pregnancy-related deaths

**70.0%**

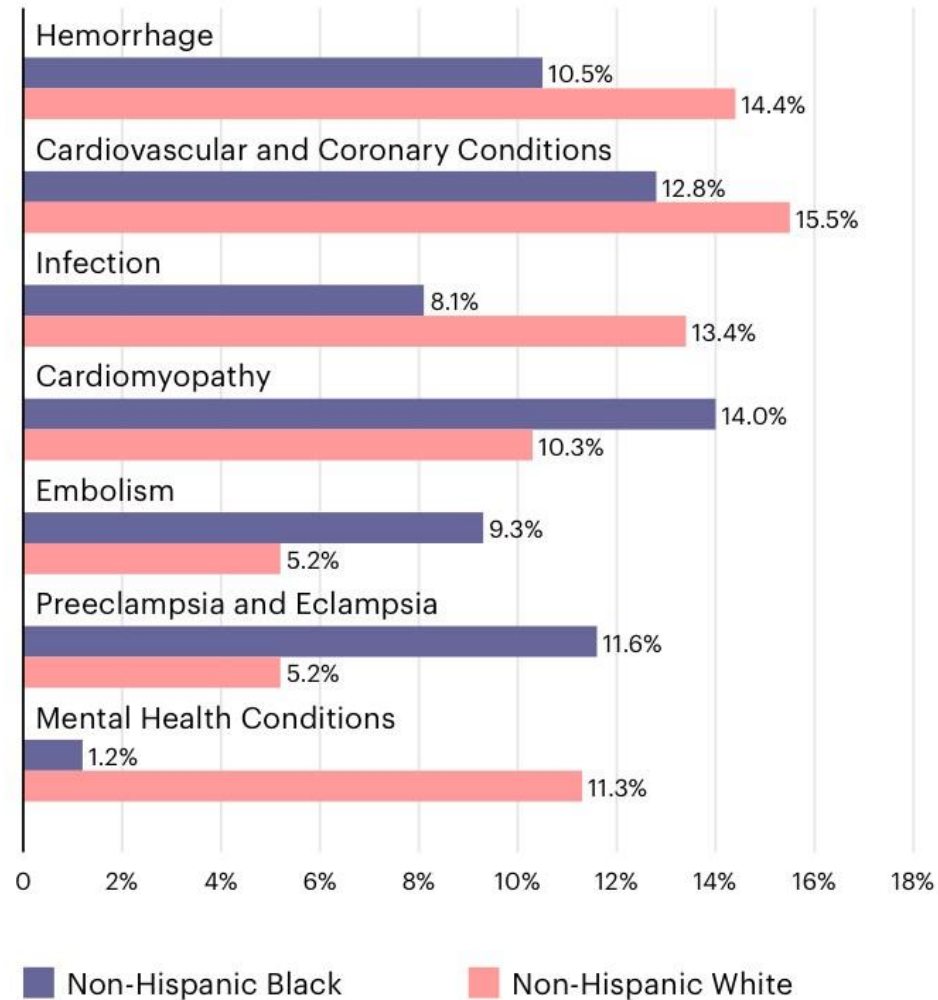

of pregnancy-related deaths from hemorrhage are preventable

**68.2%**

of pregnancy-related deaths from cardiovascular and coronary conditions are preventable

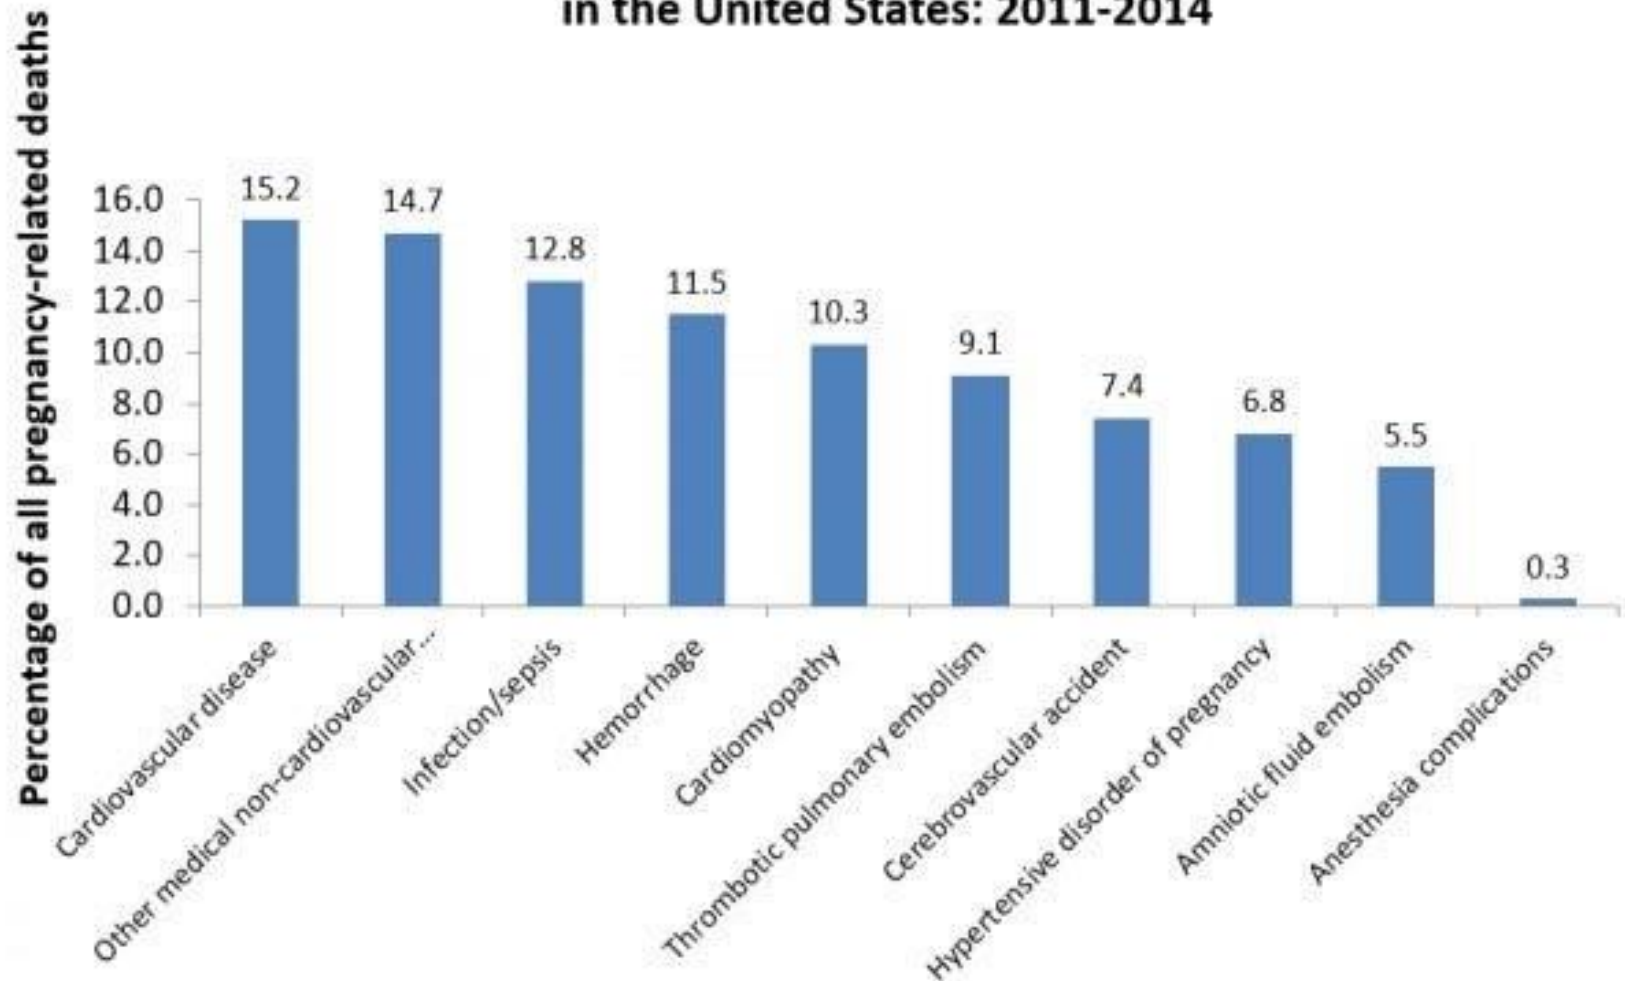

Source: Review to Action. *Report From Nine Maternal Mortality Review Committees.*  
<https://reviewtoaction.org>. Published 2018.

## Leading Underlying Causes of Pregnancy-Related Deaths, by Race-Ethnicity

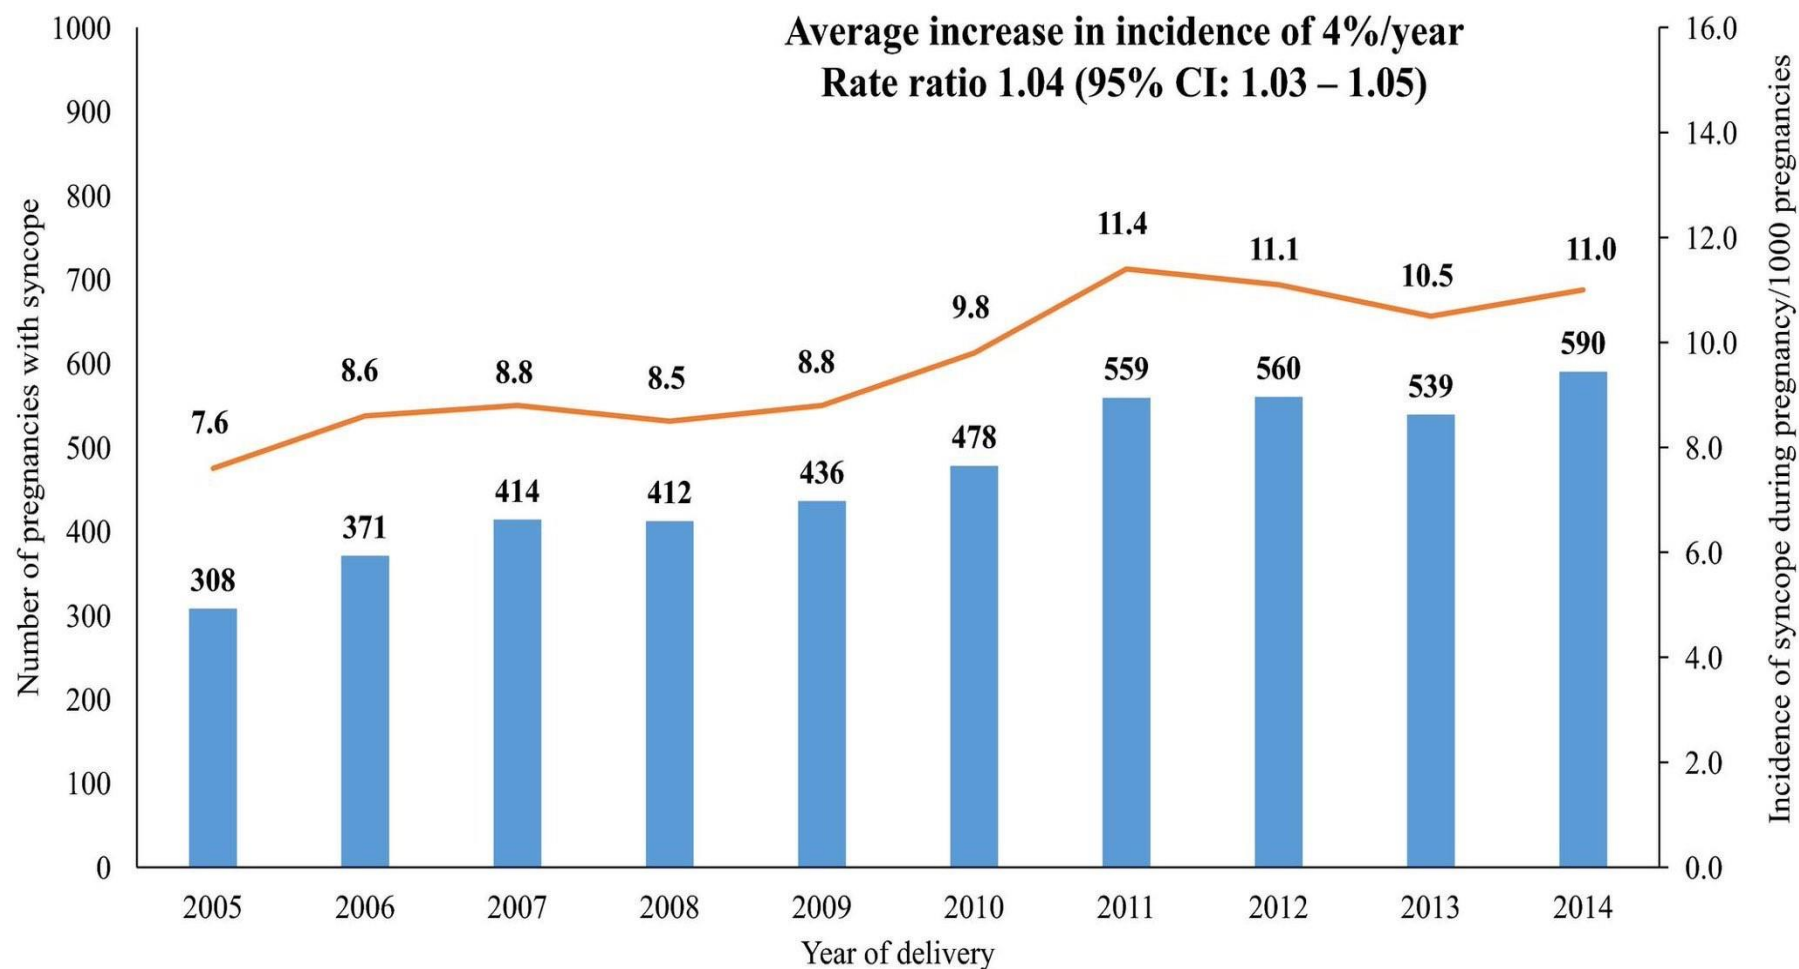

Source: CDC Foundation 2018

## Causes of pregnancy-related death in the United States: 2011-2014

Note: The cause of death is unknown for 6.5% of all pregnancy-related deaths.

# SYNCOPE DURING PREGNANCY

# PREGNANCY COMPLICATIONS AND HEART DISEASE

Women who experience certain pregnancy and delivery complications are at a greater risk of heart disease and stroke later in life.

## COMPLICATIONS THAT CAN INCREASE RISK:

- High blood pressure (HBP)
- Pre-eclampsia (HBP with certain other signs or symptoms)
- Baby is pre-term (born before 37 weeks)
- Baby is small for gestational age (weighs much less than normal, given timing of delivery)
- Gestational diabetes (high blood sugar in pregnancy)

## 5 STEPS TO A HEART HEALTHY PREGNANCY:

1. Get early and regular prenatal care.

2. Exercise regularly and keep weight gain within general guidelines.

3. Do not smoke (ever!) or drink alcohol during pregnancy.

4. Eat regular, healthful meals and take prenatal vitamins with folate during pregnancy.

5. Limit salt and caffeine, which can increase blood pressure or cause an irregular heartbeat in the mother.

Talk to your health care provider about heart disease and stroke and #getHeartChecked.

WOMEN'S  
HEART  
ALLIANCE

# PREGNANCY IS FIRST STRESS TEST

## PREGNANCY COMPLICATIONS & HEART DISEASE RISK

### PREGNANCY can be NATURE'S STRESS TEST ON THE HEART.

Women are at greater risk of having heart disease or a stroke if they had the following pregnancy complications:

**HIGH BLOOD PRESSURE  
OR PREECLAMPSIA**

**GESTATIONAL  
DIABETES**

**PRETERM BIRTH  
(BEFORE 37 WEEKS  
OF PREGNANCY)**

Many women don't get back  
to their pre-pregnancy weight  
within 12 months postpartum

**THIS ALSO MAY  
RAISE YOUR  
RISK FOR CARDIAC  
PROBLEMS**

### WHAT YOU CAN DO

**HEALTH PROBLEMS  
DURING PREGNANCY**  
— even if they disappear  
afterward — can signal  
**TROUBLE FOR  
YOUR HEART**

Make sure your primary care  
doctor knows if you had these  
pregnancy complications.

Know your risk for heart  
disease now and as you age

Adopt healthy habits: exercise daily, eat a  
heart-healthy diet, maintain a healthy weight

Information provided for educational purposes only. Please consult your health care provider about your specific health needs.

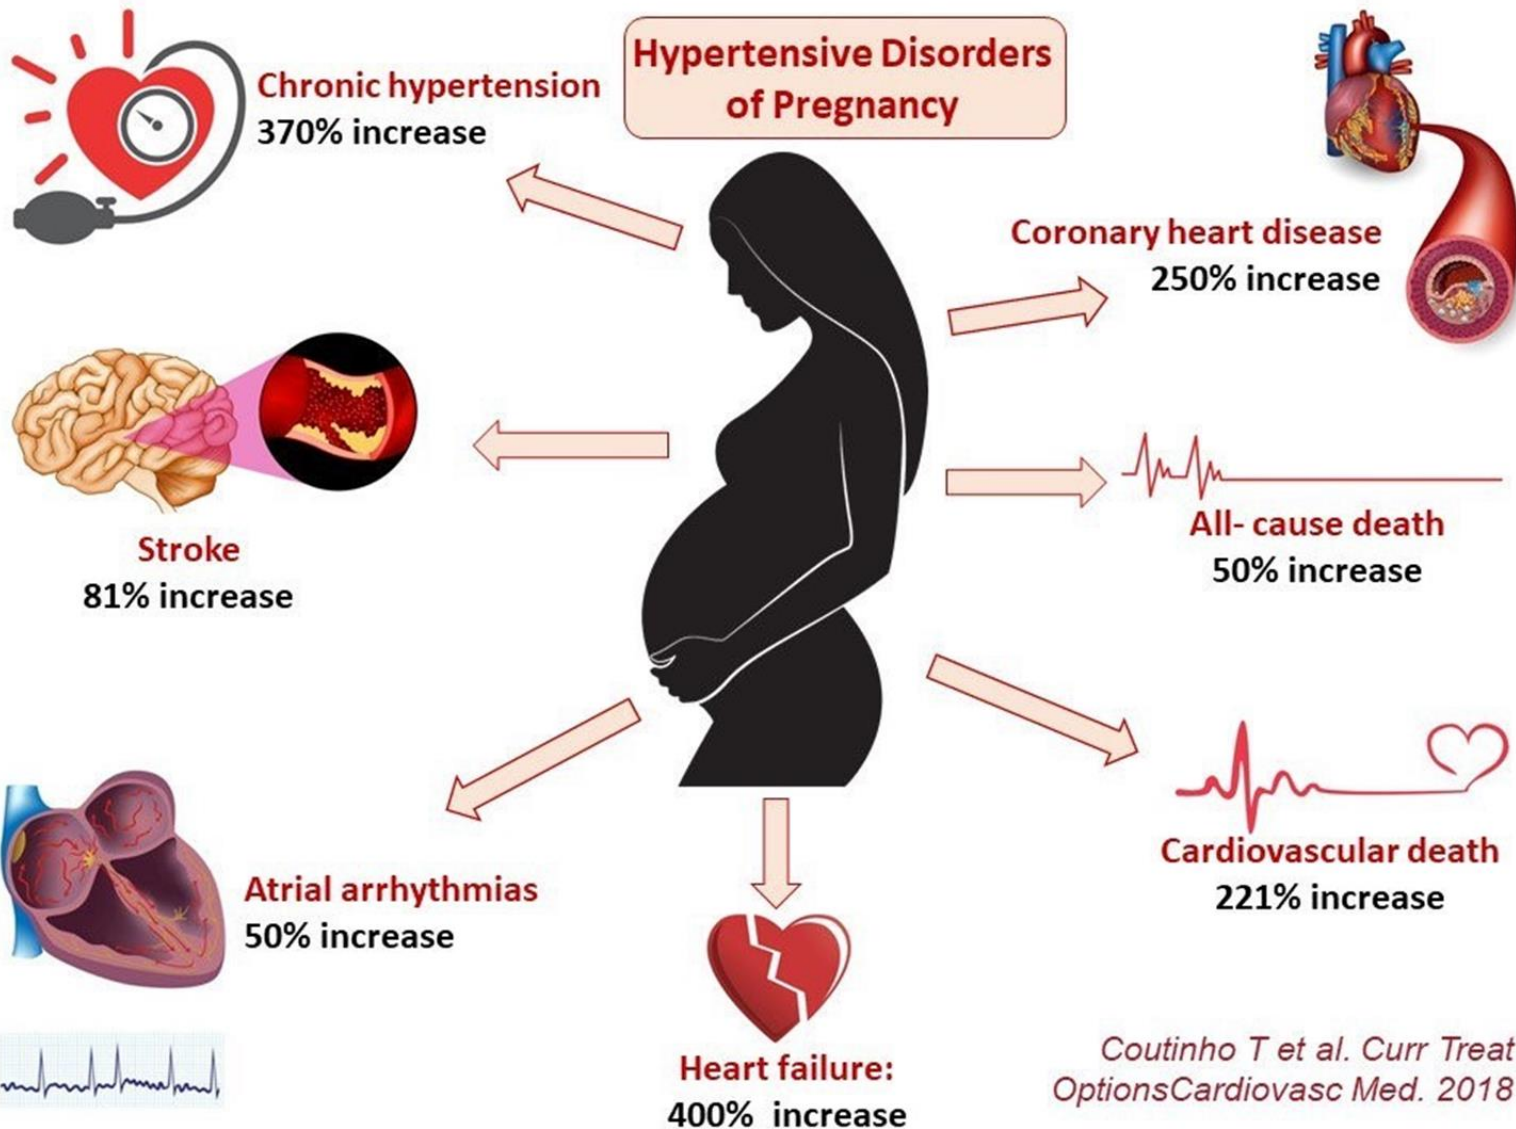

Go to [CardioSmart.org/Women](https://www.CardioSmart.org/Women) to learn more about heart risk factors and tips to stay healthy.

# PREGNANCY COMPLICATIONS

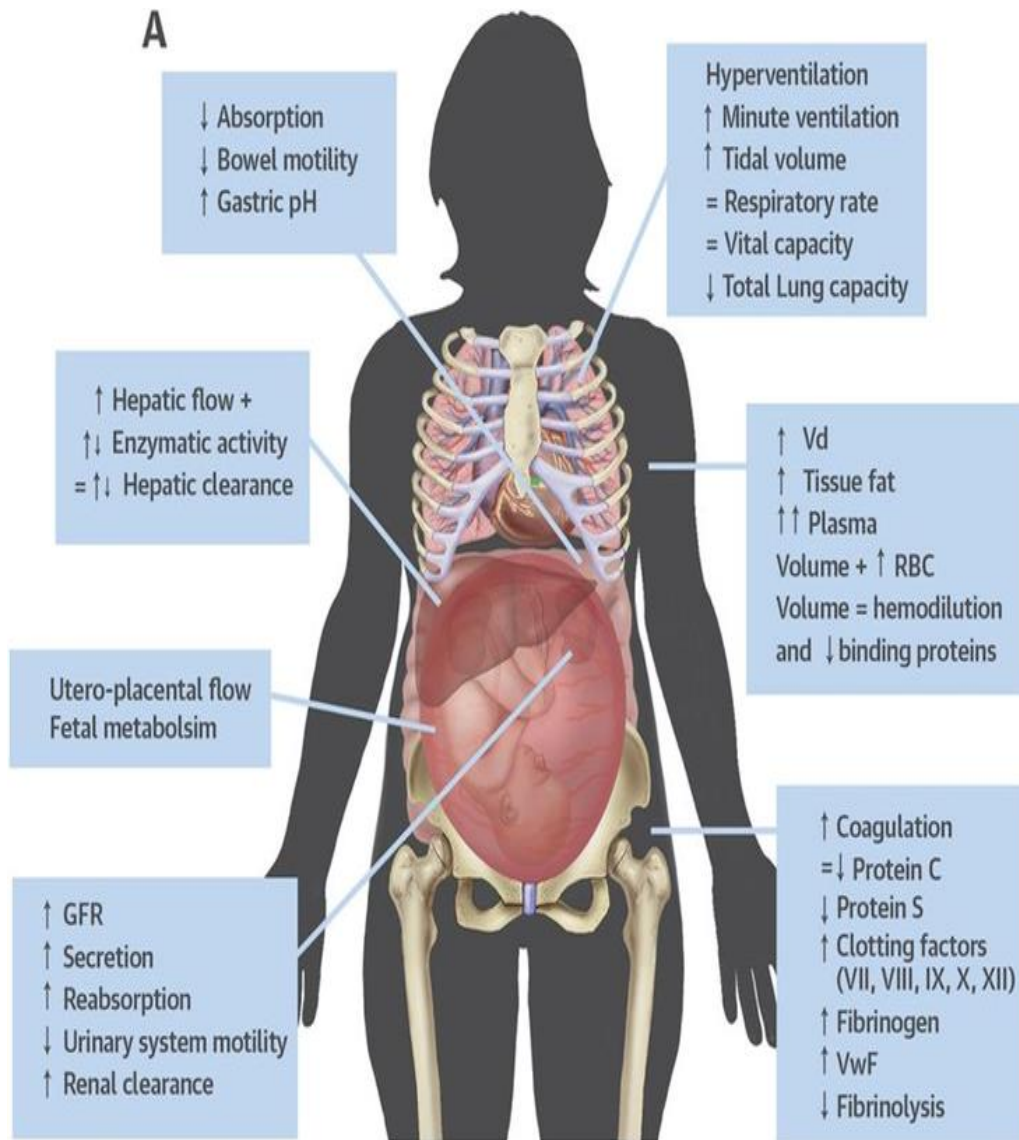

- Detailed pregnancy history integral component of risk assessment for women
- Pregnancy complications: preeclampsia, gestational diabetes, pregnancy-induced hypertension, preterm delivery are early indicators ↑ CV risk
- Cardiovascular, metabolic stress of pregnancy → potential for early prediction future CV risk
- Preeclampsia, gestational hypertension → ↑ CVD risk
  - 3-6X ↑ subsequent hypertension
  - 2x ↑ ischemic heart disease, stroke
  - Residual endothelial dysfunction, association with ↑ CAC
- Gestational diabetes → 7x ↑ risk type 2 DM

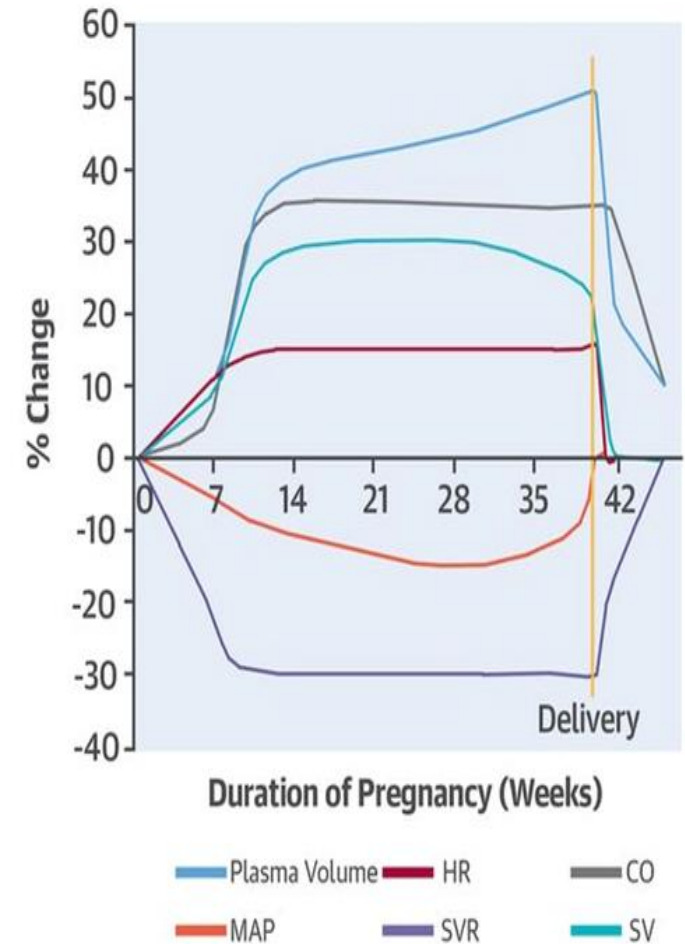

**A**

**B**

# RISK FACTORS FOR PREGNANCY-INDUCED HTN

- Obesity
- Chronic HTN
- Gestational HTN
- First time pregnancy
- Multiple pregnancy
- Pre-existing vascular disease
- Personal or family hx of preeclampsia
- Collagen (connective tissue) vascular disease
- Age >40 years
- Diabetes
- Renal disease

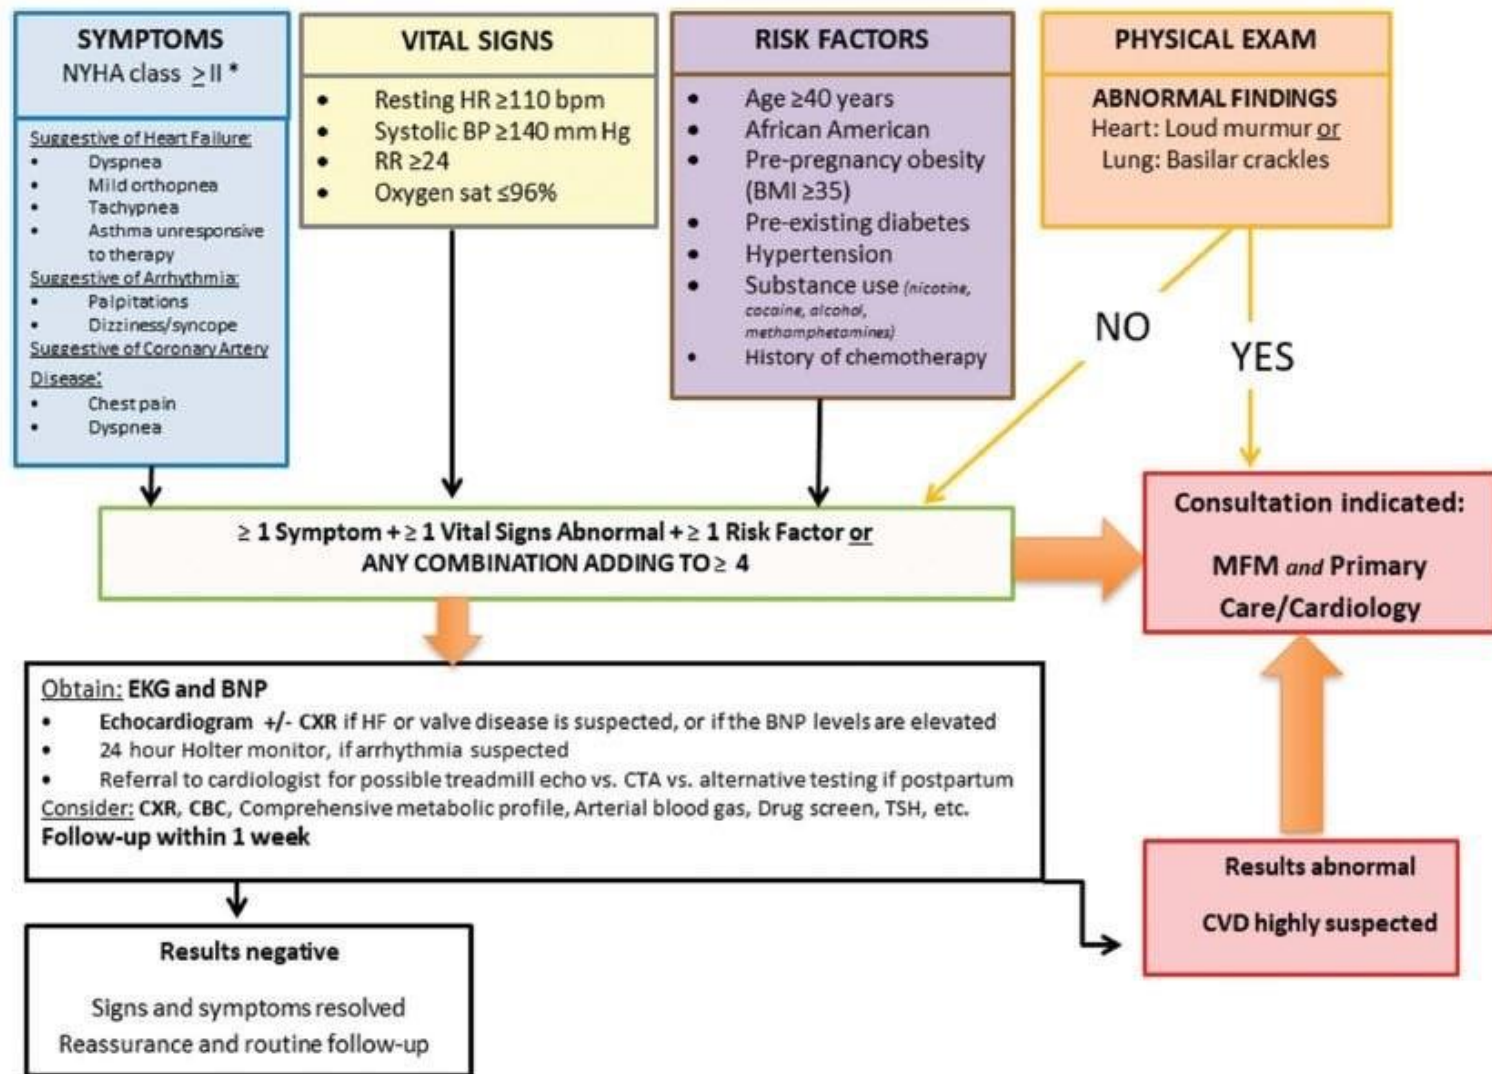

Bushnell 2014 Circ and JACC

**Table 2.** How to Differentiate Common Signs and Symptoms of Normal Pregnancy Versus Those That Are Abnormal and Indicative of Underlying Cardiac Disease

	ROUTINE CARE	CAUTION*†	STOP†‡
	Reassurance	Nonemergent Evaluation	Prompt Evaluation Pregnancy Heart Team
<b>History of CVD</b>	None	None	Yes
<b>Self-reported symptoms</b>	None or mild	Yes	Yes
Shortness of breath	No interference with activities of daily living; with heavy exertion only	With moderate exertion, new-onset asthma, persistent cough, or moderate or severe OSA§	At rest; paroxysmal nocturnal dyspnea or orthopnea; bilateral chest infiltrates on CXR or refractory pneumonia
Chest pain	Reflux related that resolves with treatment	Atypical	At rest or with minimal exertion
Palpitations	Few seconds, self-limited	Brief, self-limited episodes; no lightheadedness or syncope	Associated with near syncope
Syncope	Dizziness only with prolonged standing or dehydration	Vasovagal	Exertional or unprovoked
Fatigue	Mild	Mild or moderate	Extreme
<b>Vital signs</b>	Normal		
HR (beats per minute)	<90	90–119	≥120
Systolic BP (mm Hg)	120–139	140–159	≥160 (or symptomatic low BP)
RR (per minute)	12–15	16–25	≥25
Oxygen saturation	>97%	95–97%	<95% (unless chronic)
<b>Physical examination</b>	Normal		
JVP	Not visible	Not visible	Visible >2 cm above clavicle
Heart	S3, barely audible soft systolic murmur	S3, systolic murmur	Loud systolic murmur, diastolic murmur, S4
Lungs	Clear	Clear	Wheezing, crackles, effusion
Edema	Mild	Moderate	Marked

Abbreviations: BP, blood pressure; CVD, cardiovascular disease; CXR, chest x-ray; HR, heart rate; JVP, jugular venous pressure; OSA, obstructive sleep apnea; RR, respiratory rate.

\*If unclear, any combination of factors in the yellow column that add up to 4 or more should prompt further evaluation.

**Figure 1.** Cardiovascular Disease Assessment in Pregnant and Postpartum Women. \*The NYHA Functional Classification is available at [http://www.heart.org/HEARTORG/Conditions/HeartFailure/AboutHeartFailure/Classes-of-Heart-Failure\\_UCM\\_306328\\_Article.jsp](http://www.heart.org/HEARTORG/Conditions/HeartFailure/AboutHeartFailure/Classes-of-Heart-Failure_UCM_306328_Article.jsp). Abbreviations: BMI, body mass index; BNP, brain natriuretic peptide; BP, blood pressure; CBC, complete blood count; CVD, cardiovascular disease; CXR, chest x-ray; EKG, electrocardiogram; HR, heart rate; MFM, maternal-fetal medicine; TSH, thyroid stimulating hormone; NYHA, New York Heart Association; RR, respiratory rate. (Modified from California Department of Public Health, 2017; supported by Title V funds. Developed in partnership with California Maternal Quality Care Collaborative Cardiovascular Disease in Pregnancy and Postpartum Taskforce. Visit [www.CMQCC.org](http://www.CMQCC.org) for details.)

**Table 1. Pregnancy-Related Complications**

Condition and Background	Postpartum Test and Screening	Management Considerations	Long-Term Goals
<b>Gestational Diabetes</b>			
Women with gestational diabetes have a sevenfold increased risk of developing type 2 diabetes.	Fasting plasma glucose or 75-g, 2-hour OGTT at 4–12 weeks postpartum; screening should happen every 3 years. If the initial test in the postpartum shows prediabetes, they should be screened for diabetes yearly.	Encourage breastfeeding Women with impaired fasting glucose, impaired glucose tolerance, or diabetes should be referred for preventive or medical therapy.	Early detection of overt diabetes; diabetes prevention
<b>Diabetes</b>			
Poorly controlled diabetes increases risk of nephropathy, neuropathy, retinopathy, cardiovascular disease, and other chronic morbidity. Poorly controlled diabetes is associated with birth defects in the next pregnancy.	Patients should demonstrate good control of blood sugars with hemoglobin A <sub>1c</sub> <6.5	Weight management Referral for preventive and medical therapy For women with type 1 diabetes, thyroid screening once if never completed. In subsequent pregnancies, consider low-dose aspirin 81 mg QD to reduce pre-eclampsia risk	Goal Hemoglobin A <sub>1c</sub> : 6.0–6.5% (42–48 mmol/L) recommended Achieve without hypoglycemia
<b>Preeclampsia and Gestational Hypertension</b>			
Women with preeclampsia have an increased risk of recurrence in subsequent pregnancies. These women also have a two-fold increased risk of subsequent cardiovascular disease.	Blood pressure monitoring for 72 hours postpartum Blood pressure monitoring 7–10 days after delivery Postpartum blood pressure check	In subsequent pregnancies, consider low-dose aspirin 81 mg QD to reduce preeclampsia risk	Maintain blood pressure <120/80 Maintain healthy weight
<b>Chronic Hypertension</b>			
Uncontrolled hypertension in the postpartum period	Blood pressure monitoring for 72 hours postpartum	In subsequent pregnancies, consider low-dose aspirin	Maintain blood pressure <120/80

# HTN- CLASS I RECOMMENDATIONS

- Women with chronic primary or secondary hypertension, or previous pregnancy-related hypertension, should take **low dose aspirin** from the 12th week of gestation until delivery
- **Calcium** supplementation (of at least 1g/d, orally) should be considered for women with low dietary intake of calcium (<600 mg/d) to prevent preeclampsia

# HTN- CLASS I RECOMMENDATIONS

Severe hypertension in pregnancy should be treated with safe & effective antihypertensive medications such as **methyldopa**, **labetalol** and **nifedipine**, with consideration of maternal & fetal side effects

# RECOMMENDATIONS: TREATMENT OF HTN POSTPARTUM

Due to the increased risk of future HTN & stroke 1-30 years after delivery in women with a history of preeclampsia it is reasonable to:

- (1) evaluate all women **starting 6 mo to 1 year** postpartum & all those with a HX of preeclampsia/eclampsia
- (2) document their history is a CVD risk factor
- (3) Evaluate & treat for **CVD risk factors** including hypertension, obesity, smoking & dyslipidemia

# STROKE & PREGNANCY

- Pregnancy-related HTN is the leading cause of both hemorrhagic & ischemic stroke in pregnant & post partum women
- Stroke is not common during pregnancy
- Risk for stroke is higher in pregnant women (34 per 100K) vs nonpregnant women (21 per 100K)
- Highest risk in the 3<sup>rd</sup> trimester & post partum

# PREGNANCY SCAD & NON-PREG SCAD

	P-SCAD -54	NP-SCAD -269
Presentation	STEMI- 57% EF<35%- 26%	STEMI- 36% EF<35%- 10%
Assoc with FMD	42%	64%
Pregnancy Hx	Multiparous- 91% Infertility tx- 28% Pre-eclampsia- 11%	76% 16% 6%
LM SCAD	24%	5%
Multivessel SCAD	33%	14%
Age	35 yrs	47 yrs
Race	89% Caucasian	97 Caucasian

## CENTRAL ILLUSTRATION: Features of Pregnancy-Associated Spontaneous Coronary Artery Dissection

Spontaneous Coronary Artery Dissection (SCAD)	 Pregnancy-associated SCAD (P-SCAD)	Recommended areas of P-SCAD research:
<p>A coronary artery hematoma ± tear limits coronary blood flow to the myocardium</p>  <p>Hematoma</p>  <p>Tear in arterial wall</p>	<ul style="list-style-type: none"> <li>• <b>Frequently occurs in first month postpartum</b> (majority of these within first week after delivery)</li> <li>• <b>P-SCAD presentation often severe:</b> <ul style="list-style-type: none"> <li>- ST-segment elevation myocardial infarction</li> <li>- Reduced left ventricular function</li> <li>- Left main and/or multivessel SCAD</li> </ul> </li> <li>• <b>Compared to non-pregnancy-associated SCAD:</b> <ul style="list-style-type: none"> <li>- P-SCAD has a higher risk presentation</li> <li>- P-SCAD patients are older at time of first childbirth and more frequently have history of multiple pregnancies</li> <li>- P-SCAD patients have fewer extracoronary vascular abnormalities</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li> Hemodynamic stressors</li> <li> Hormonal fluctuations</li> <li> Oxytocin release in breastfeeding mothers</li> <li> Older, multiparous mothers</li> <li> Relationship to:             <ul style="list-style-type: none"> <li>- Eclampsia/ pre-eclampsia</li> <li>- Peripartum cardiomyopathy</li> <li>- Fibromuscular dysplasia and other extracoronary vascular abnormalities</li> </ul> </li> </ul>

# PREVENTION OF HEART DISEASE IN WOMEN

**WOMEN & HEART DISEASE**

CardioSmart  
American College of Cardiology

**Be Your Own HEART HERO**

**STAND UP for your HEALTH!**

- GET SCREENED every year
- DON'T IGNORE symptoms
- ASK QUESTIONS about your heart health

**HEART DISEASE is the #1 KILLER OF WOMEN**

It causes MORE WOMEN'S DEATHS THAN CANCER, including breast cancer

**HEART ATTACK SYMPTOMS**

- Arm, neck, jaw or back pain
- Chest pain or discomfort
- Shortness of breath
- Nausea or vomiting
- Dizziness or lightheadedness

**OTHER SYMPTOMS:**

- Cold sweat
- Unusual tiredness
- Trouble sleeping

**RISK FACTORS UNIQUE TO WOMEN**

Many women experience NO SYMPTOMS. It's important to KNOW YOUR RISKS.

- MENOPAUSE
- Many OVARIAN CYSTS
- HIGH BLOOD PRESSURE or DIABETES during pregnancy

Information provided for educational purposes only. Please consult your health care provider about your specific health needs.

# Statistics for CVD in America

- 840,678 Americans died of cardiovascular disease (CVD= Heart & Stroke) in 2016
- Every 40 seconds, someone has a heart attack AND someone has a stroke
- Nearly half of all Americans adults have some form of CVD (Coronary disease, High blood pressure and Stroke)
- AHA Heart Disease and Stroke Stats- 2019 Update/ Circulation

# AHA STATISTICAL UPDATE 2019

**Chart 13-16. Cardiovascular disease (CVD) mortality trends for males and females (United States, 1979–2016).**

CVD excludes congenital cardiovascular defects (*International Classification of Diseases, 10th Revision [ICD-10]* codes I00–I99). The overall comparability for cardiovascular disease between the *International Classification of Diseases, 9th Revision* (1979–1998) and *ICD-10* (1999–2015) is 0.9962. No comparability ratios were applied.

EJ Benjamin, *Circulation* March 2019

# PATIENT AWARENESS, STIGMA, AND PHYSICIAN AWARENESS AND TRAINING EFFECT CVD CARE IN WOMEN

## CENTRAL ILLUSTRATION: Knowledge, Attitudes and Beliefs Regarding Cardiovascular Disease in Women: The Women's Heart Alliance

**1**  
**#**

Cardiovascular disease (CVD) is the top cause of death in women in the U.S.  
CVD kills more women than all cancers combined

**400,000**

women died from CVD in 2016 (U.S.A.)

And yet ...

Only 45% of women know CVD is #1 killer

A need to raise awareness of risk and symptoms of heart disease

26% of women find CVD embarrassing, assuming risk is solely linked to weight

A need to de-stigmatize the disease risk by countering stereotypes with facts

Only 40% of routine care includes a heart risk check

A need to invest in women's CVD research and physician education/training

Only 39% of primary care physicians (PCPs) make CVD a top priority

Only 22% of PCPs and 42% of cardiologists feel well prepared to assess CVD risk

Bairey Merz, C.N. et al. J Am Coll Cardiol. 2017;70(2):123-32.

## Emerging Risk Factors

SLE: 3-fold higher risk of IHD events [18]

Rheumatoid arthritis: elevates IHD risk as much as DM [18]

Gestational diabetes

- 4-fold higher risk of DM
- 59% higher risk of MI [17]

Hypertension in pregnancy:

- Gestational HTN and preeclampsia: 3-fold higher risk of IHD [18]

Early menopause confers 4.5 times higher risk of IHD [99]

Depression is more prevalent in women  
Doubles the risk of IHD [16]

## Traditional Risk Factors

Menopause results in ↑ TG, ↑ LDL, ↓ HDL

Women are less likely to achieve lipid goals (OR 0.50) [97]

80% of women ≥75 have HTN

Only 29% have adequate BP control [22,98]

Diabetes confers a 45% higher risk of IHD [16]

Smoking confers a 25% higher risk of IHD [96]

Obesity confers a higher risk of IHD in women (64% vs 46%) [94]

Women have a higher prevalence of inactivity  
25% of US women get no regular physical activity [95]

Family History of premature atherosclerosis confers a 2 fold higher risk of IHD in men and women [100]

# SEX-BASED DISPARITIES IN OUTCOMES & QUALITY OF CARE

- Less diagnostic testing or angiography
- Delay in Reperfusion
- Fewer Revascularizations
- Less Pharmacotherapy
- Less Cardiac Rehab referral & completion
- Higher morbidity after MI
- Higher in-hospital mortality with angina, STEMI & ACS
- Higher mortality in younger women (<55yrs)

# CVD IN WOMEN

- Women have a higher prevalence of angina
- Women have a lower burden of obstructive CAD
- Women have a poorer prognosis compared to men
- Clinical presentation- chest pain most common but also weakness, dyspnea, nausea, and neck, jaw and back pain

• WISE investigators, NHLBI WISE study, Am Heart Journal 2001;141:735-741

**EMORY**  
WOMEN'S HEART  
CENTER

# RECOMMENDATIONS FOR PREVENTION OF HEART DISEASE

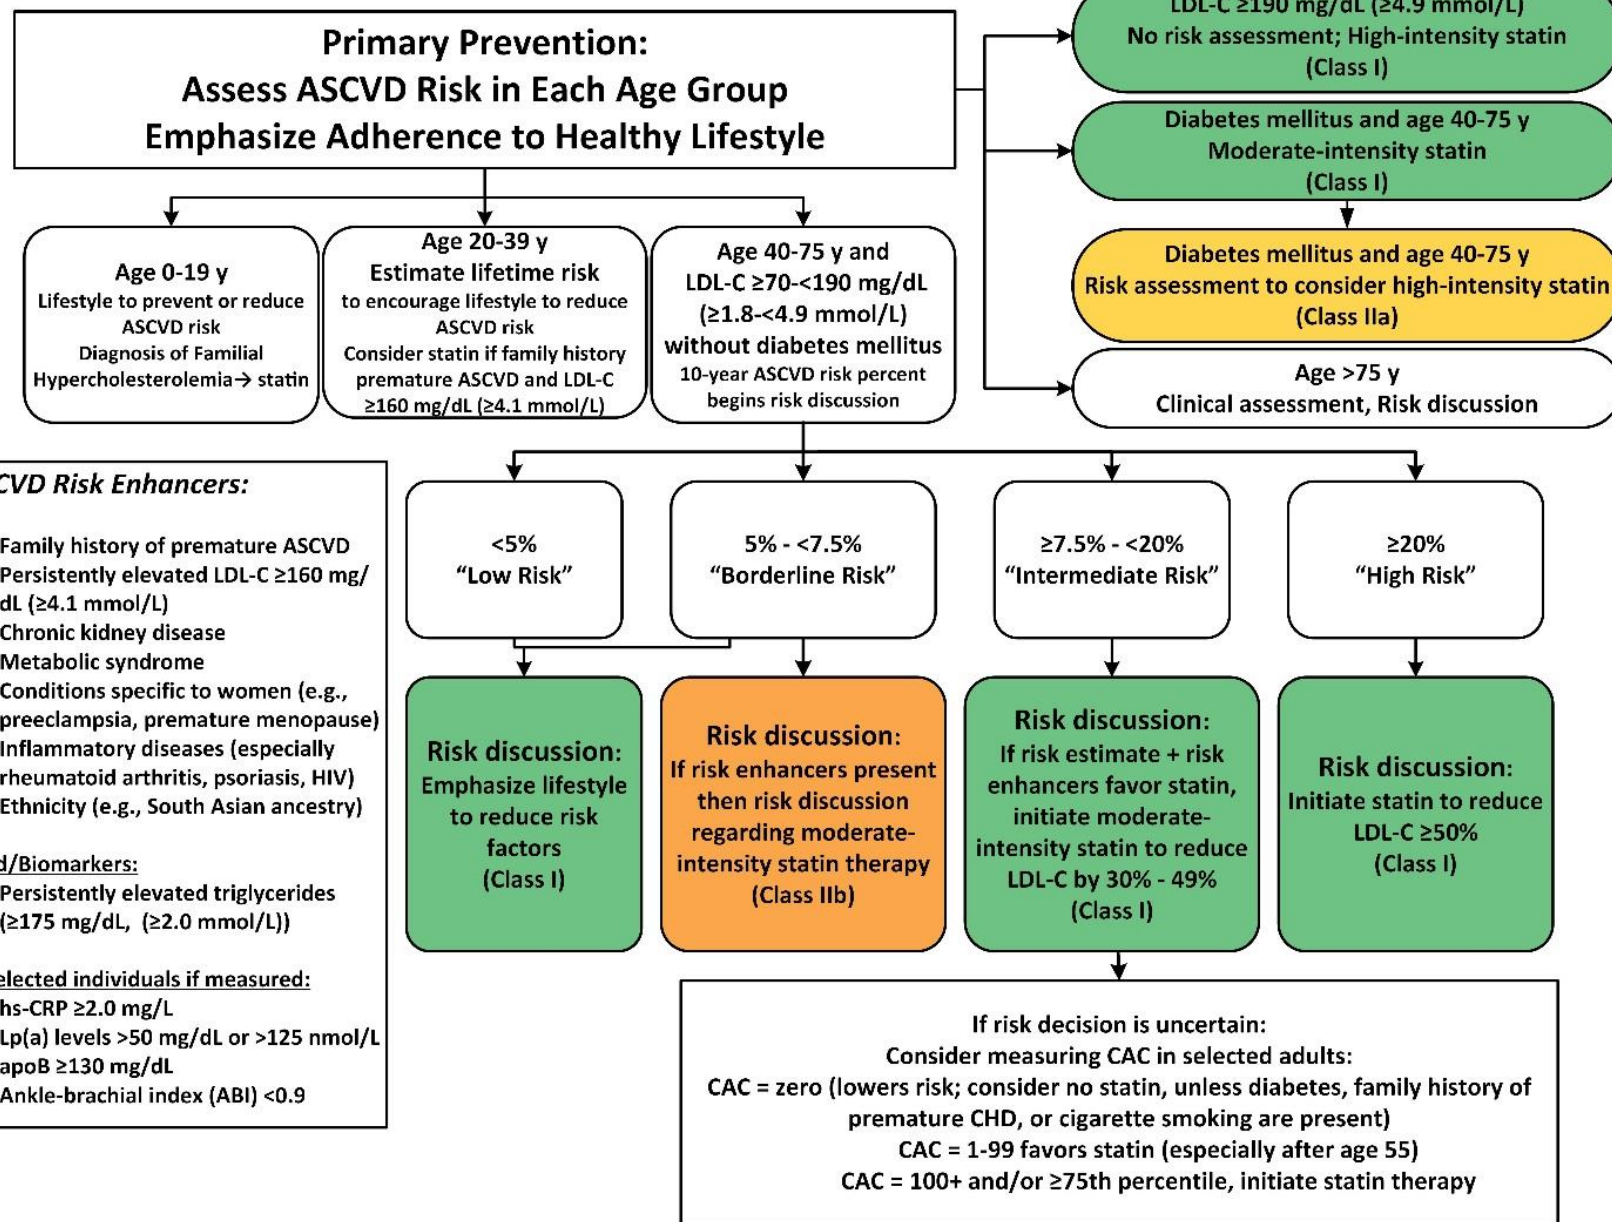

- Evaluation after pregnancy complication- Gest DM, HTN, Preeclampsia, Eclampsia
- Evaluation of CVD risks in Rheumatic/ Autoimmune disorders
- Close observation after Breast Cancer, Chemotherapy, Radiation
- Close observation with Depression/Stress, domestic violence, trauma, etc

# RECOMMENDATIONS FOR PREVENTION OF HEART DISEASE IN ALL WOMEN

- HTN control
- DM control
- Lipid control
- Smoking Cessation
- Obesity- BMI<25 ideal
- Lifestyle- Diet and Physical activity

**Fig. 3:**

Rosamond PhD<sup>2</sup>, Deepak L. Bhatt MD MPH<sup>3</sup>, Melissa C. Caughey PhD<sup>1</sup>

# Burden of cardiovascular risk factors has increased among young adults

Gupta et al. *J Am Coll Cardiol.* 2014;64:337-45

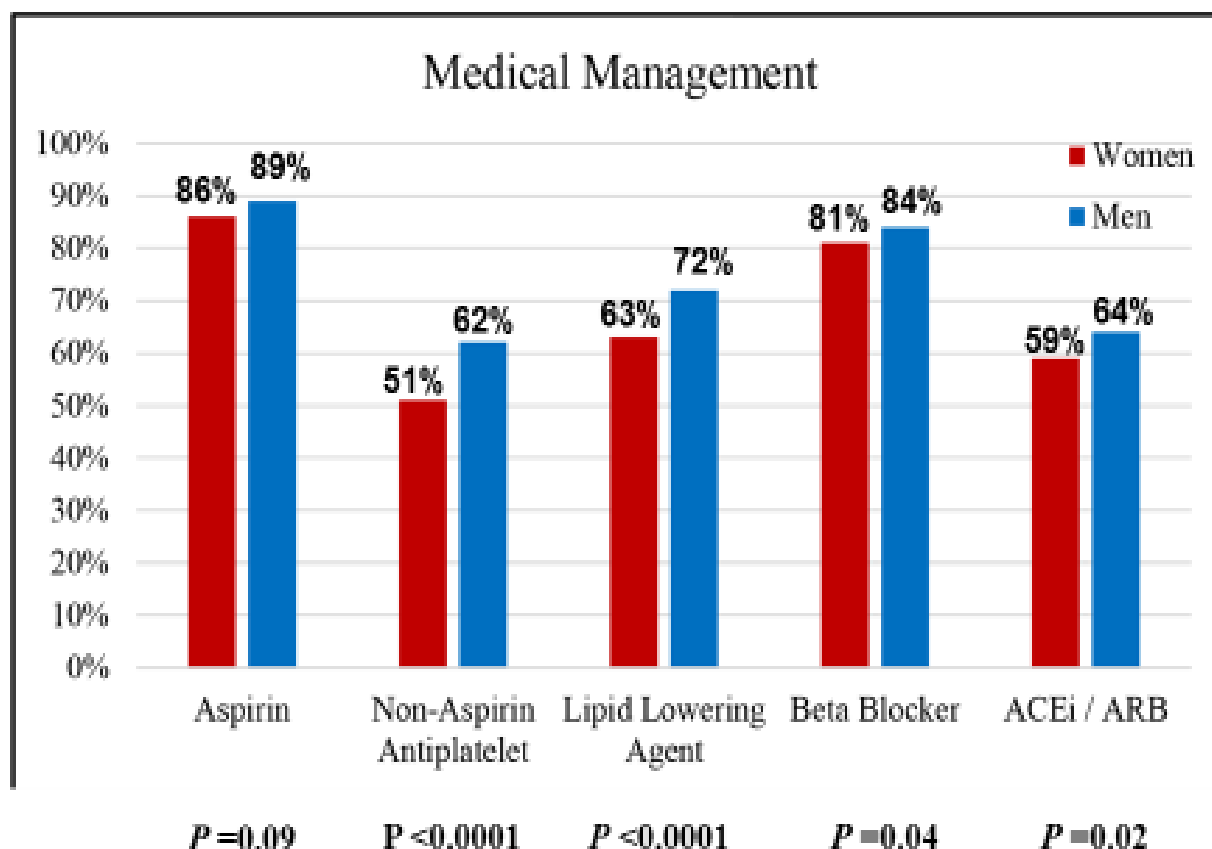

# Characteristics of Young Patients with AMI

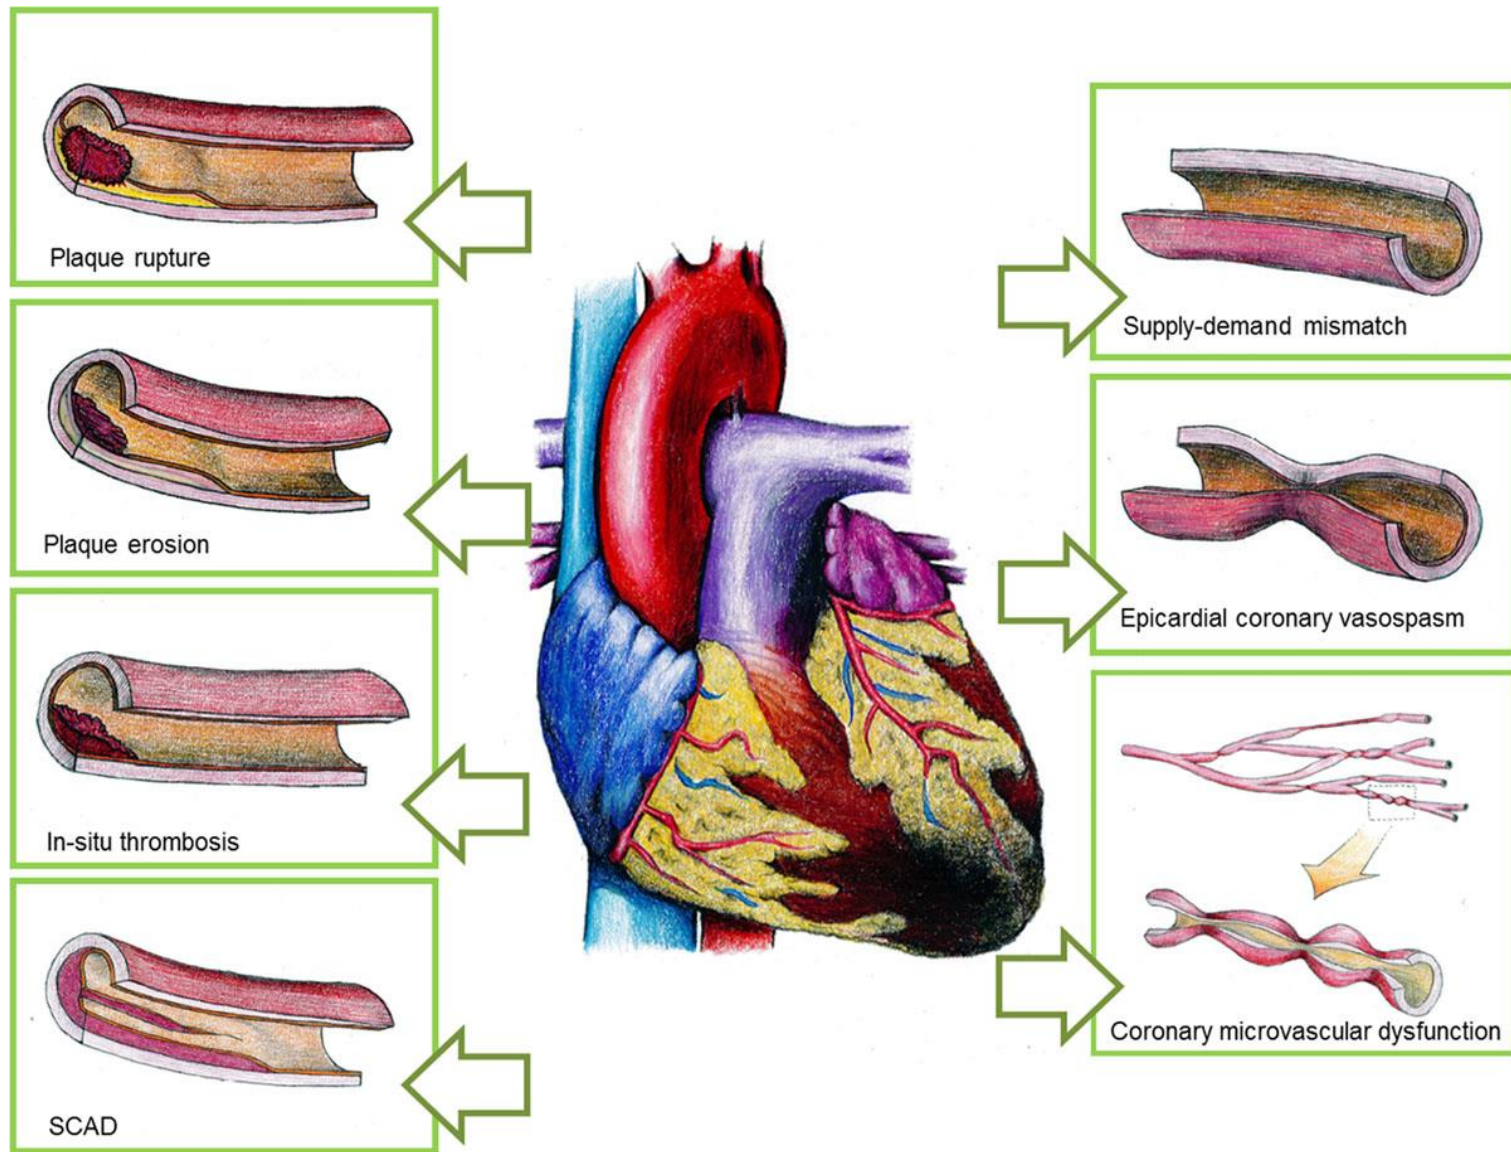

- **Young Women were more likely to be black, to present with non-STEMI and to have higher prevalence of hypertension, diabetes, and prior stroke**

	Women	Men	
Characteristic	N=2884	N=5853	P-value
Age (mean)	48 ± 0.2	48 ± 0.1	0.2
Black	52%	41%	<0.0001
Hypertension	71%	64%	0.0005
Diabetes mellitus	39%	26%	<0.0001
Stroke	10%	6%	0.0003
ST-segment elevation‡	16%	26%	<0.0001

## Treatment Disparities: Young Women vs. Men with AMI

- Young women were less likely to receive evidence-based AMI medications

# PLAQUE EROSION VS RUPTURE

## WOMEN AND ACUTE MI

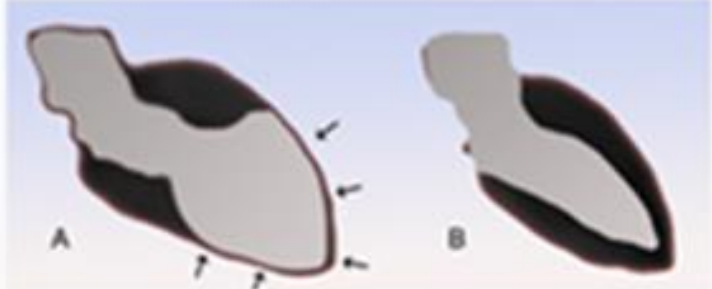

- In women older than 50 years, plaque rupture is the most common cause of acute MI
  - Associated with hyperlipidemia
  - Plaque is vulnerable with a thin fibrous cap overlying a necrotic core
- In younger women, plaque erosion is more often responsible for infarction
  - Associated with smoking
  - Estrogen may protect against plaque rupture
  - Eroded plaque is rich in smooth muscle cells and proteoglycans
  - Associated with less obstruction and calcification

# TAKOTSUBO/ STRESS CM IN WOMEN

- Mainly affects postmenopausal women
- Generally after extreme emotional or exertional trigger
- ACS with no obstructive CAD & effects multiple artery territories

**Takotsubo cardiomyopathy**

*Classification and external resources*

Schematic representation of takotsubo cardiomyopathy (A) compared to the situation in a normal person (B).

ICD-9	429.83 <a href="#">🔗</a>
DiseasesDB	33976 <a href="#">🔗</a>
eMedicine	article/1513631 <a href="#">🔗</a>
MeSH	D054549 <a href="#">🔗</a>

Templin C, NEJM 2015

# MICROVASCULAR/ ENDOTHELIAL DYSFUNCTION

- Defined as limited coronary flow reserve and endothelial dysfunction
- Associated with worse outcome
- Increased rate of cardiac death, stroke and heart failure
- Annual MACE event rate of 2.5% in women

Wei J, Mehta PK, Results from WISE, JACC Intervention 2012

# MI WITH NONOBSTRUCTED CORONARY ARTERIES (MINOCA)

- MI with nonobstructive CAD
  - found in 6% of all MIs
  - Median age 58
  - 50% women
  - Possibly due to structural dysfunction, vasospasm, and thrombotic disorders
  - Has guarded prognosis with better 12 mo mortality compared to obstructive CD

Beltrame JF, J Intern Med 2013

# PREVENTION OF STROKE IN WOMEN

**UNDERSTANDING STROKE**

**What is a STROKE?**

A stroke occurs when a blood vessel in the brain is blocked or burst.

Without oxygen carried by the blood, the brain begins to die.

A stroke occurs every 40 seconds in the U.S.

Brain damage can occur in a matter of minutes.

**Watch for the SIGNS**

Stroke symptoms appear quickly and suddenly, so it's important to know the signs and act fast.

- Severe headache & confusion
- Numbness, tingling or weakness
- Loss of balance
- Vision changes
- Trouble speaking
- Loss of movement in face or limbs, especially on one side

If you or a loved one starts to experience one or more of these symptoms, **CALL 911 IMMEDIATELY.**

**Reduce YOUR RISK**

Adopt a healthy lifestyle, including proper diet and exercise.

Lower your blood pressure & cholesterol.

If you smoke, set a plan to quit and follow it!

Information provided for educational purposes only. Please consult your health care provider regarding your specific health needs.

# SCOPE OF THE PROBLEM

- 200K more disabled women than men after stroke
- Women are more likely to be living alone & widowed before stroke
- Women are more often institutionalized after stroke & have poorer recovery
- Nearly half of stroke survivors have residual deficits 6 mo after strokes

# FIRST STROKE PREVENTION GUIDELINES FOR WOMEN- 2014

## Guidelines for the Prevention of Stroke in Women

### A Statement for Healthcare Professionals From the American Heart Association/American Stroke Association

Age			X
Prior cardiovascular disease			X
Obesity			X
Diet			X
Smoking			X
Metabolic syndrome			X
Depression		X	
Psychosocial stress		X	

# KEY POINTS: UPDATE ON 2014 AHA/ASA GUIDELINE FOR PREVENTION OF STROKE IN WOMEN

- Women experience more prevalent stroke, more death from stroke and more disability from stroke
- HTN worse with age & race in women
- Afib associated with higher risk of stroke, cardiac events, and mortality in women

- Women with DM have higher risk of stroke compared to men with DM
- Evidence lacking for stroke risk and abnormal lipids (TC, LDL, HDL, TG)
- Migraine is more common in women & migraine with aura assoc with ischemic stroke
- Estrogen-containing OCP may increase risk of stroke in migraine with aura

# SUMMARY- CVD IN WOMEN

Unique risk factors for stroke & heart disease in women:

- Pregnancy- gestational diabetes, preeclampsia, eclampsia,
- Hormone therapy
- More hypertension at  $\geq$ age 65 females
- More sedentary, obese females
- More high cholesterol in females

# Q&A
